

Section 6 - Programme learning outcomes

In general terms, the programmes provide opportunities for students to develop and demonstrate the following learning outcomes. (Categories – Knowledge and understanding (K), Skills and other attributes (S), and Transferable skills (*))

- knowledge and understanding of the essential facts, concepts, principles and theories relating to computing and computer applications (K);
- understanding of the implications of recent research in Computer Science, artificial intelligence and related fields, and how such research results can be incorporated into computer-based systems (K);
- understanding of the professional, moral and ethical aspects of the use of computer-based systems, and ability to recognise any risks or safety aspects in a given context (K);
- knowledge of how computers are programmed and used; advanced programming; software engineering and team work for developing a significant software system; the fundamental technologies used for artificial intelligence; the functioning of the Internet and the World Wide Web; the main concepts of database technology and design; background theory necessary for a deeper understanding of computing and computers (K);
- depending on their programme of studies, students may also gain a knowledge of the following key practical application technologies: operating systems; graphics; robotics, bioinformatics, information security, applied artificial intelligence and human-computer interfaces; theoretical foundations of algorithms and programming (K);

- ability to deploy appropriate theory, practices and tools for the modelling, specification, design, implementation and evaluation of computer-based systems (including standalone computer systems, information systems, embedded systems, distributed systems and web-based systems) to meet given requirements under practical constraints (S);
- employ the research skills needed to investigate a defined topic under supervision, through an extended individual project (S);
- interpersonal skills, including the ability to work as a member of a development team, recognising/respecting the viewpoints of others, recognising the different roles within a team and the different ways of organising teams (S);*
- problem identification, analysis and solution using critical assessment and reasoned argument (S);*
- taking responsibility for own learning and developing habits of reflection on that learning (S);*
- skills in written communication, project documentation, verbal presentation; numeracy and computation (S);*
- use of information technology (including spreadsheets, databases, word processing, email and WWW) (S); *
- information handling and retrieval (including the use of libraries and computer technology) (S);*
- ability to work autonomously, and to demonstrate time management and organisational skills (S);*

Take homes

- Strong emphasis on practical work
 - Large amounts of time in the lab
 - 150 hours for a module is not unrealistic
- Still need significant amounts of theory
- Team work a skill to be learnt
 - CS2810 Example of best practice nationally
- Ethics and professionalism
